

EVOLine® Port

Foldaway column with electricity sockets.

Where aesthetical cleanliness and tidiness are necessary, IFI now offers the possibility to insert the **EVOLine® Port** column on the work shelf of bar counters and back counters, solely in correspondence of a neutral compartment below.

EVOLine® Port is a foldaway column containing electricity sockets that allows hiding underneath; the work shelf the electric connections, and use them only when necessary.

IFI makes the **EVOLine® Port** electrified column available in two standard configurations:

1. with three VDE (Schuko) sockets - installed on counter or back counter
2. with two VDE (Schuko) sockets and one Italian socket (by-pass) - installed on counter or back counter.

The power supply voltage is 220 volt.

The removable column has a stainless steel lid for perfect adaptation with the work shelf, again in stainless steel, with silver painted collar, and is assembled in fixed position.

EVOLine® Port is particularly useful when electricity sockets are required on the bar counter, in furnishings without counter top or with suspended counter top or with completely transparent counter top (in glass or other material): where the electricity socket would be visible by the client. From today, thanks to the removable **EVOLine® Port** column, the sockets disappear underneath the work shelf, leaving the furnishing an aesthetically clean and tidy image.

You can find the prices of EVOLine® Port inside the IFI reserved area: www.ifi.it/extranet

How it works:

Press the flap lid slightly.

Remove the column.

Connect the electricity socket.

Insert the column in its seat again.
